

NutriMetric: Demo Video Script

Event-Driven Calorie & Nutrition Intelligence · Target length: 2 minutes 30 seconds max

Use this as a teleprompter while recording. Follow Show / Click / Say in order.

Setup (before you hit record)

- App open at <http://localhost:3010>, logged out.
- One known-good account ready.
- Sample meal photo and a small text/tabular PDF ready on the desktop.
- Goals already set (or set once live). Browser zoom about 100-110%. Hide bookmarks bar.
- Tone: calm, confident, systems-aware — not a basic CRUD walkthrough.

0:00 – 0:12 · Cold open (landing)

Show: Landing page. Pan slowly over headline and CTAs.

Click: Nothing yet.

Say: "This is NutriMetric — an event-driven calorie and nutrition platform. It's not a single Next.js CRUD app: the UI talks to a Spring API gateway, with separate identity, core, and AI services, plus RabbitMQ for async work."

0:12 – 0:25 · Sign in

Click: Sign in to Dashboard → enter email/password → submit.

Show: Redirect into Overview with personalized welcome.

Say: "Multi-user auth is JWT-based. Each user's meals, goals, and imports stay private behind the gateway."

0:25 – 0:50 · Dashboard analytics (bento grid)

Show: Scroll the top cards slowly.

Point: Daily calories → Macro balance → Weekly trend → Goal vs actual → Micronutrients.

Say: "The dashboard is a bento grid of weekly intelligence: calorie trend with target overlay, today's macro split, seven-day macro stacks, goal-versus-actual for the week, and micronutrient mentions mined from meal notes."

0:50 – 1:15 · Goals + meal timeline

Show: Goal settings card (calorie ring, macros, weight goal).

Click (optional, ~3s): Pencil → glance Edit Targets → Cancel.

Show: Meal Timeline — date range and All / Breakfast / Lunch / Dinner / Snacks.

Click: Last 7 days if needed, then filter Breakfast → back to All.

Say: "Users set daily calorie, protein, carb, fat, and weight targets. The meal feed supports time-range listing with date and meal-type filters — assignment requirements one through three."

1:15 – 1:40 · AI photo meal log

Click: + Log Meal → Quick AI Photo → drop or select food photo.

Show: Analyzing state → Manual tab with pre-filled values.

Click: Confirm meal type if needed → Save Meal.

Show: New card in the timeline; goals update if visible.

Say: "Multimodal extraction: the image goes through the gateway to the AI service, Gemini returns structured nutrition, and the form is pre-filled so the user confirms before we persist to core."

1:40 – 2:05 · PDF import (async story)

Click: Import PDF Diary → select tabular PDF → upload.

Show: Success toast ("extracting in background...") and brief Import History if quick.

Do not wait: Skip full completion if slow — cut after queue confirmation.

Say: "Bulk PDF import is asynchronous. Core writes the job and an outbox event in one transaction, RabbitMQ delivers to AI for parsing, and the UI short-polls status — so Gemini never blocks the request thread."

2:05 – 2:22 · Chat assistant

Click: Floating chat button.

Type + send: Give me a weekly recap

Backup line if Gemini is slow: "can i include soya bean to improve my protein intake?"

Show: Assistant reply with week totals / goal context (or nutrition answer).

Say: "The nutrition assistant classifies intent — log meals, check or update goals, daily and weekly summaries, or general nutrition Q&A — then grounds answers in real core data."

2:22 – 2:30 · Close (weight + outro)

Show: Quick scroll to Weight tracking card (1–2 seconds).

Click: Close chat if still open.

Say: "Weight logging rounds out the goal loop. NutriMetric: multimodal logging, reliable async imports, and conversational nutrition — built as a production-shaped microservice stack. Thanks for watching."

Optional end card (2s): repo name + docker compose up --build -d → localhost:3010

Timing cheat sheet

- 0:00 Landing + architecture one-liner
- 0:12 Login
- 0:25 Charts
- 0:50 Goals + filters
- 1:15 AI photo log
- 1:40 PDF async / outbox
- 2:05 Chat weekly recap
- 2:22 Weight + close

Recording tips

- Practice once with a timer; cut any pause over 2 seconds.
- If Gemini is slow, record chat/PDF as a second take and splice.
- Prefer 1080p, mic close, no music under speech.
- Do not open Docker Desktop or the IDE — stay in the product.
- If login fails, refresh and use a known-good account before the take.

This script covers goals, meals, filters, reports, AI photo, chat, multi-user auth, and PDF import inside 2:30.
